IN THE CLAIMS:

1. (Currently Amended) A method for converting a file access data structure from a first endianness to a second endianness by a processor, the method comprising the steps of:

identifying, from a descriptor look up table, a series of actions to perform on elements of the file access data structure; and

performing the identified series of actions on the elements of the file access data structure to convert the file data structure from the first endianness to the second endianness.

2. (Currently Amended) A method of converting elements of a file access data structure from a first endianness to a second endianness by a processor, the method comprising the steps of:

determining if the file access data structure is a critical path data structure;

converting, in response to the file access data structure being a critical path data structure, the elements from the first endianness to the second endianness using a set of specific code functions;

converting, in response to the file access data structure not being a critical path data structure, a header of the file access data structure from the first endianness to the second endianness using a second set of specific code functions; and

11   calling a byte swapping engine to convert selected elements of the file access data

12   structure from the first byte order to the second byte order.

1   3. (ORIGINAL) The method of claim 2 wherein the file access data structure further

2   comprises a direct access file access data structure.

1   4. (Currently Amended) A <u>file</u> system for converting elements of a file access data struc-

2   ture from a first endianness to a second endianness, the system comprising:

3   an input buffer, the input buffer storing the file access data structure <u>with the first</u>

4   <u>endianness</u> to be converted;

5   a byte swapping engine, the byte swapping engine operative interconnected with a

6   descriptor table<u>, with the descriptor table listing a series of actions to perform when con-</u>

7   <u>verting the file data structure from the first endianness to the second endianness</u>; and

8   an output buffer, the byte swapping engine placing the file access data structure

9   <u>with the second endianness</u> in the output buffer after conversion.

1   5. (ORIGINAL) The system of claim 4 wherein the descriptor table further comprises a

2   set of entries describing various file access data structures, each entry further comprising

3   a size field and an operation field.

1   6. (ORIGINAL) The system of claim 4 wherein the file access data structure further

2   comprises a direct access file access data structure.

1   7. (Currently Amended) A method for converting a data structure from a first byte order

2   to a second byte order <u>by a processor</u>, the method comprising the steps of:

3   reading an element entry from a descriptor table;

4   performing an action on an element of the data structure, the action being defined

5   in the element entry read from the descriptor table <u>to convert the data structure from the</u>

6   <u>first byte order to the second byte order</u>; and

7   placing the element in an output buffer.

1   8. (ORIGINAL) The method of claim 7 wherein the step of performing an action on an

2   element further comprises the step of copying the element from an input buffer to the

3   output buffer.

1   9. (ORIGINAL) The method of claim 7 wherein the step of performing an action on an

2   element further comprises the step of byte swapping the element.

1   10. (ORIGINAL) The method of claim 7 wherein the element entry of the descriptor

2   table further comprises a field describing a size of the element and a field describing an

3   action to be performed.

1   11. (ORIGINAL) A file server for use in a network storage environment, the file server

2   comprising:

4

3   a byte swapping engine, the byte swapping engine performing a defined operation

4   on each of a plurality of elements of a file access data structure.

1   12. (ORIGINAL)   The file server of claim 11 wherein the file server further com-

2   prises a descriptor look up table, the descriptor look up table having a plurality of entries,

3   each of the plurality of entries associated with a specific file access data structure.

1   13. (ORIGINAL)   The file server of claim 12 wherein each of the plurality of entries

2   further comprises a plurality of elements, each of the elements having a size field and an

3   operation field.

1   14. (ORIGINAL)   The file server of claim 13 wherein the defined operation is de-

2   fined by the operation field of the entry associated with the file access data structure.

1   15. (ORIGINAL) A computer-readable medium, including program instructions execut-

2   ing on a computer, for converting elements of a file access data structure from a first en-

3   dianness to a second endianness, the method comprising the steps of:

4   determining if the file access data structure is a critical path data structure;

5   converting, in response to the file access data structure being a critical path data

6   structure, the elements from the first endianness to the second endianness using a set of

7   specific code functions;

8   converting, in response to the file access data structure not being a critical path

9   data structure, a header of the file access data structure from the first endianness to the

10   second endianness using a second set of specific code functions; and

11   calling a byte swapping engine to convert selected elements of the file access data

12   structure from the first byte order to the second byte order.

1   16. (Currently Amended) A method for converting elements of a file access data struc-

2   ture from a first endianness to a second endianness by a processor, the method compris-

3   ing the steps of:

4   determining a type of the file access data structure, where the type of the file ac-

5   cess structure is the first endianness;

6   processing, in response to the file access data structure of being of a first type, the

7   file access data structure along a first processing path;

8   processing, in response to the file access data structure being of a second type, the

9   file access data structure along a second processing path, where the data structure of the

10   second type is the second endianness.

1   17. (ORIGINAL) The method of claim 16 wherein the first type further comprises a

2   critical path data structure.

1   18. (ORIGINAL) The method of claim 16 wherein the first processing path further com-

2   prises a set of specifically coded functions.

1   19. (ORIGINAL) The method of claim 16 wherein the second processing path further

2   comprises a byte swapping engine.

1   20. (Currently Amended) A method for converting a data <u>by a processor,</u> comprising:

2   calling a byte-swapping engine;

3   providing a file access data structure as input to the byte-swapping engine;

4   providing a descriptor look up table to the byte-swapping engine;

5   identifying, from the descriptor look up table, a series of actions to perform on

6   elements of the file access data structure in order to swap bytes of the file access data

7   structure from a first endianness to a second endianness; and

8   performing the identified series of actions on the elements of the file access data

9   structure <u>to convert the file access data structure.</u>

1   21. (PREVIOUSLY PRESENTED) The method as in claim 20, further comprising:

2   using as the file access data structure a file having Direct Access File System

3   (DAFS) protocol.

1   22. (PREVIOUSLY PRESENTED) The method as in claim 20, further comprising:

2   determining if the file access data structure is a critical path data structure, and if

3   it is, perform byte swap operations using specific code functions.

1   23. (PREVIOUSLY PRESENTED) The method as in claim 20, further comprising:

2   determining if the file access data structure is a critical path data structure, and if

3   it is not, perform byte swap operations on a data structure header.

1   24. (PREVIOUSLY PRESENTED) The method as in claim 20, further comprising:

2   swapping bytes of the data structure as needed, in response to swapping bytes of

3   the file access data structure.

1   25. (PREVIOUSLY PRESENTED) The method as in claim 20, further comprising:

2   determining if an element entry of the descriptor look up table is nested;

3   branching to the nested entry;

4   identifying, from the descriptor look up table, a series of actions to perform on

5   elements of the nested entry in order to swap bytes of the entry from a first endianness to

6   a second endianness.

1   26. (Currently Amended) A computer to convert a data structure by a processor, com-

2   prising:

3   means for calling a byte-swapping engine;

4   means for providing a file access data structure as input to the byte-swapping en-

5   gine;

6   means for providing a descriptor look up table to the byte-swapping engine;

8

7   means for identifying, from the descriptor look up table, a series of actions to per-

8   form on elements of the file access data structure in order to swap bytes of the file access

9   data structure from a first endianness to a second endianness; and

10   means for performing the identified series of actions on the elements of the file

11   access data structure.

1   27. (PREVIOUSLY PRESENTED) The computer as in claim 26, further comprising:

2   means for using as the file access data structure a file having Direct Access File

3   System (DAFS) protocol.

1   28. (PREVIOUSLY PRESENTED) The computer as in claim 26, further comprising:

2   means for determining if the file access data structure is a critical path data struc-

3   ture, and if it is, perform byte swap operations using specific code functions.

1   29. (PREVIOUSLY PRESENTED) The computer as in claim 26, further comprising:

2   means for determining if the file access data structure is a critical path data struc-

3   ture, and if it is not, perform byte swap operations on a data structure header.

1   30. (PREVIOUSLY PRESENTED) The computer as in claim 26, further comprising:

2   means for swapping bytes of the data structure as needed, in response to swapping

3   bytes of the file access data structure.

1   31. (PREVIOUSLY PRESENTED) The computer as in claim 26, further comprising:

2   means for determining if an element entry of the descriptor look up table is

3   nested;

4   means for branching to the nested entry;

5   means for identifying, from the descriptor look up table, a series of actions to per-

6   form on elements of the nested entry in order to swap bytes of the entry from a first en-

7   dianness to a second endianness.

1   32. (Currently Amended) A computer readable media, comprising:

2   said computer readable media containing instructions for execution on a processor

3   for the practice of a method for converting a data structure by a processor, the method

4   having the steps of,

5   calling a byte-swapping engine;

6   providing a file access data structure as input to the byte-swapping engine;

7   providing a descriptor look up table to the byte-swapping engine;

8   identifying, from the descriptor look up table, a series of actions to perform on

9   elements of the file access data structure in order to swap bytes of the file access data

10   structure from a first endianness to a second endianness; and

11   performing the identified series of actions on the elements of the file access data

12   structure.

1   33. (Cancelled)

1   Please add new claims 34 *et al.*

1   34. (New) A method of converting elements of a file access data structure from a first

2   endianness to a second endianness by a processor, comprising:

3   determining if the file access data structure is a critical path data structure; and

4   converting the elements from the first endianness to the second endianness using a

5   set of specific code functions if the file access data structure is a critical path data struc-

6   ture.

1   35. (New) The method of claim 34, further comprising:

2   converting a header of the file access data structure from the first endianness to

3   the second endianness using a second set of specific code functions if the file access data

4   structure is not a critical path data structure.

1   36. (New) The method of claim 34, further comprising:

2   calling a byte swapping engine to convert selected elements of the file access data

3   structure from the first byte order to the second byte order.

1   37. (New) A method for converting a first data structure from a to a second data structure

2   by a processor, the method comprising the steps of:

3   using a descriptor lookup table to provide actions to be performed on each ele-

4   ment of the first data structure; and

5   stepping through the descriptor table and processing each element of the first data

6   structure according to the element's size and action to convert the first data structure into

7   the second data structure.

1   38. (New) The method of claim 37, further comprising:

2   using a byte as the data structure.
